Luxid® from TEMIS Receives Designed for EMC® Documentum® Accreditation

Luxid® now embeds a native connector to EMC® Documentum® enterprise content management platform, enabling customers to conduct in-depth analyses on their value-added internal information assets.

Paris, France – November 13, 2007 – TEMIS, leading provider of Text Analytics software solutions for the Enterprise, today announced that Luxid® has received the “Designed for EMC® Documentum®” accreditation, a mark of quality and value that customers can depend on in enterprise applications. The “Designed for EMC Documentum” accreditation demonstrates that Luxid® has successfully met a comprehensive set of criteria for solid design and quality integration.

Luxid® extends the Documentum content management platform to provide users with immediate access to non-obvious information and industry-specific knowledge from internal and external data sources. It brings long-awaited answers to the challenge of information analytics, information discovery and knowledge extraction from unstructured data, which represent 80% of all data available in the Enterprise for decision-making processes.

Based on the award-winning and patent-protected TEMIS technology, Luxid® plays a business-critical role in corporations (Life Sciences, Publishing, Industry) and governments (Homeland Security) for demanding activities, such as competitive intelligence, scientific intelligence, customer sentiment analysis, reputation management, IP management or content publishing.

TEMIS is also known for its industry-specific Luxid® for Life Sciences Edition that addresses the specific needs of pharmaceutical and biotechnology companies. Leveraging Documentum content management capabilities, Luxid® for Life Sciences aims to:

- Improve research effectiveness to accelerate drug discovery by unlocking domain knowledge and competitive insight through powerful analytics,
- Manage company Intellectual Property assets with automated patent analysis and monitoring,
- Reduce adverse event-related risks to ensure drug safety and minimize company exposure through early warning detection and escalation as well as real-time patient sentiment analysis.

“EMC’s position as the leader in enterprise content management is strengthened by the support of great partners such as TEMIS,” said Randy Ziegler, Director of Developer Programs at EMC Corporation. “Partners like TEMIS build solutions and applications on the Documentum platform because customers have demonstrated their trust in EMC Documentum to manage their most critical and strategic information. The accreditation program is another way EMC earns that trust while supporting innovative offerings like Luxid®.”

“Information Intelligence is the next phase of Information Lifecycle Management. With this prestigious accreditation, Luxid® becomes one of the first Information Intelligence solutions that discovers strategic business information managed through EMC Documentum platform,” said Eric Brégand, CEO of TEMIS. “I am pleased that TEMIS and EMC Documentum’s strategic collaboration concluded in a certified solution long-awaited by our shared customers. Beyond providing strong support to design the best offering leveraging EMC Documentum platform, the Designed for EMC Documentum program is also an excellent go-to-market opportunity to ensure that Documentum customers benefit from Luxid®’s unique capabilities,” added Brégand.

TEMIS Luxid® received design accreditation by joining the Designed for EMC program; a program designed to help ISVs, VSPs and SIs design, develop and go-to-market with successful offerings based on the EMC Documentum platform. As a member, TEMIS received specialized design consultation and guidance on development of their Luxid® offering, along with access to dedicated content management technical resources. Partners can submit their offerings to be considered for the “Designed for EMC Documentum” accreditation – which if achieved, signifies to customers that the offering meets high standards for architectural compliance with Documentum practices and will provide a reliable integration with less uncertainty for joint customers.
